
What is Micropatterns?

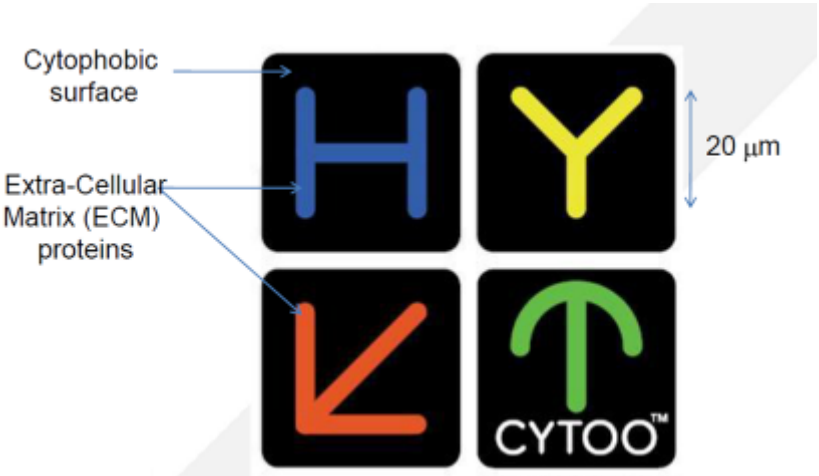
CTYOO 產品是在高階影像等級的玻璃上，先以使細胞無法貼附的 **Cytophobic** 塗料處理，再以光蝕刻的技術，精準地留下特定的幾何形狀，並在這樣的幾形狀上 coating 上特定的細胞間質蛋白 (extra cellular matrix , ECM, such as fibronecin, collgene, Laminin, ect…) 。這樣的細胞培養工具藉由精準的控制細胞貼附的型式，提供了體外培養細胞結構上的引導，使細胞表現出更接近體內生理的表型及框架，我們稱這樣的細胞培養技術為 2D + cell culture

這樣的工具可以：

☑ 提高試驗的再現性，靈敏性和歸納量化複雜的生物性狀

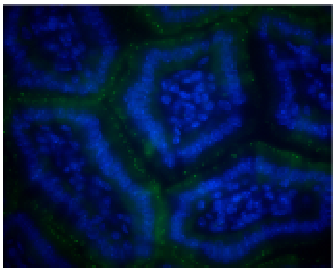
☑ 進一步分析細胞結構 、機械性刺激和細胞功能之間的關係

☑ 模擬重現細胞在生物體內的環境，並使性狀易於觀察分析



In conventional 2D cell culture the spatial information got by the cells in vivo is lost

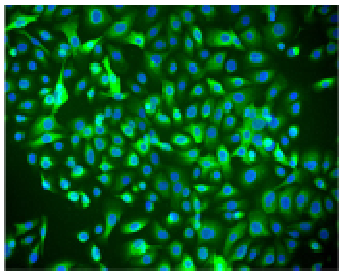
Cells in vivo



- organized
- uniform
- constrained
- polarized

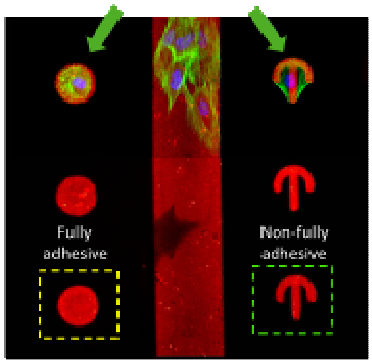
VS

Cells in 2D culture



- different shapes
- different sizes
- free to move
- non-polarized

Normalized cells

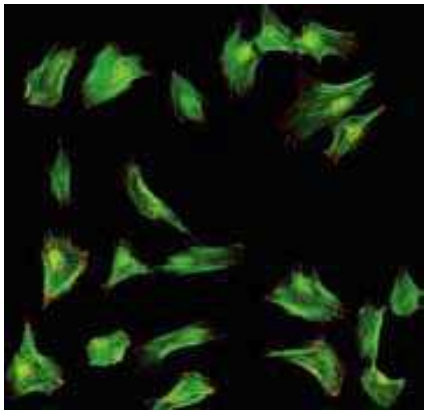


CYTOO adhesive micropatterns

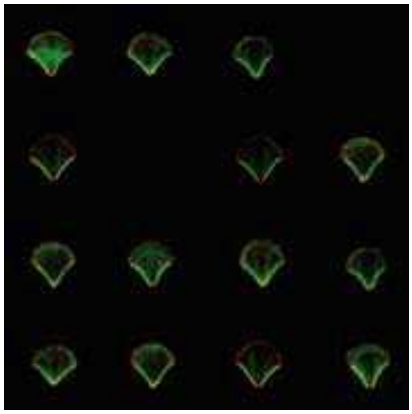
A breakthrough in quantitative cell analysis

精準的對照條件

在 CYTOO 陣列上，細胞呈現相同的結構



Cells in a standard culture dish



Cells cultured on CYTOO products

細胞貼附在塗有細胞間質蛋白的 micropattern 陣列上時，會隨著 micropattern 的引導在不能貼附的材質上張開成特定的幾何結構。這樣特定形狀的貼附接觸分布，促使細胞產生固定且再現性極高的極性機制。細胞位置、細胞形狀、細胞極性、以及細胞內部的結構都可標準化。

取得優勢

分析更直接，結果可信度更高，探索發現更快速

- Reduce cell to cell variability
- Control the location of cell compartments and protein networks
- Achieve simple and rapid image analysis
- Improve assay reproducibility
- Map a standard? averaged cell to be used as a Reference Cell™

引領潮流

Cell biology and high throughput screening

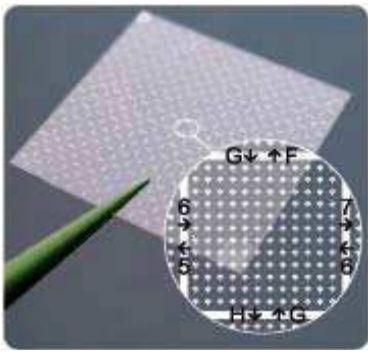
Application assays:

- Cell Shape and Actin Cytoskeleton
- Microtubule network
- Cell Polarity and Organelle Positioning
- Cell Division and Mitotic Spindle Orientation
- Quantitative Cell Phenotyping
- Cell signaling
- Toxicology
- ...

CYTOO 產品型式

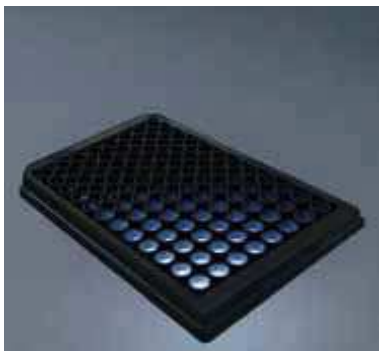
依您的需求分為

CYTOOchips™
for research



The glass coverslip format with an array of up to 20,000 micropatterns and a printed grid for easy localization.

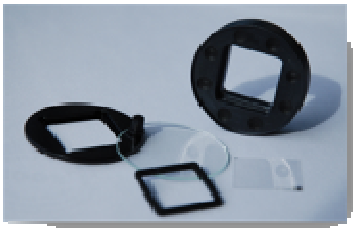
CYTOOplates™
for screening

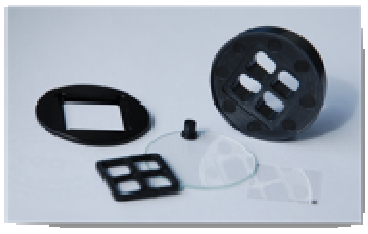


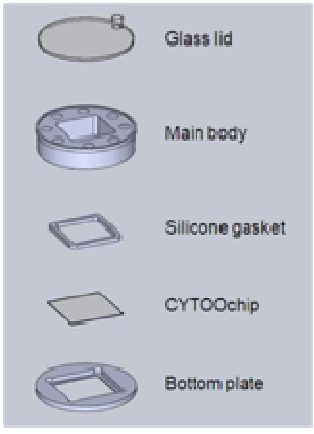
The standard glass bottom microplate format presenting over 1,000 micropatterns per well.

CYTOOchambers™ *1 and 4 wells*

另有專用規格的活體影像磁座可供長時間的活體影像擷取







很抽象嗎？來看看影片吧！

細胞在 CYTOO micro pattern 陣列上形成一致的結構
可以平均多個細胞影像，得到多個樣品數的影像定量

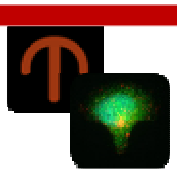
2D+ Single cells



- Mitochondria assay
- Receptor internalization
- Actin Cytoskeleton
- Cell division
- Stem cell differentiation

選擇適合您應用的 micropattern

客製化特殊 micropattern 請洽創世紀生技

	Disc	Crossbow	H	Y	L
Micropatterns					
Stretched cells					
Application examples:					
Cell shape control and arraying	✓	✓	✓	✓	✓
Cell polarization		✓			
Cell division			✓	✓	✓
Cell contractility analysis				✓	✓
Noteworthy Applications	. Array cells . Control cell spreading and contraction . Control ciliogenesis . . .	. Polarize cells . Study internal organelle/endomembrane spatial organisation . Study microtubule dynamics . Control asymmetric cell division	. Control symmetric cell division . Quantify cell-cell adhesion/contacts . . .	. Study Multipolar divisions and supernumerary centrosomes . . .	. Measure contractility . Measure subtle alterations in spindle orientation during mitosis . . .

已經發表在文獻上 micropattern 應用的眾多細胞種類包括：

- Epithelial cells (HeLa, RPE-1, CHO, MDCK, BSC, MCF10A)
- Fibroblasts (murine NIH-3T3, BHK)
- Adenocarcinoma cell lines (MDA-231, A549)
- Hepatic cell lines (HepG2)
- Primary cells (Rat astrocytes, Rat ventricular myocytes, myoblasts)
- Neurons and neuron progenitors (SH-SY5Y; hippocampal and cortical neurons)
- Stem Cells (Human mesenchymal stem cells, mouse embryonic stem cells/mESCs)

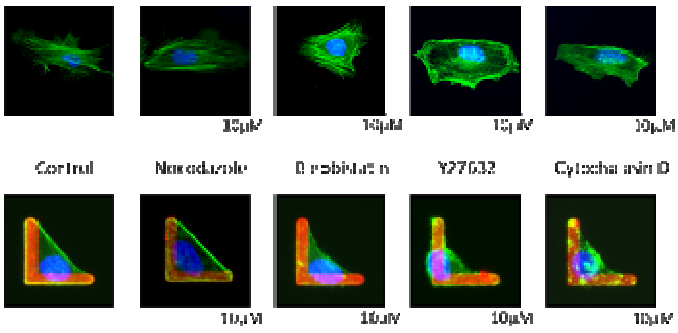
Build a Reference Cell™ for powerful cell phenotype quantification

Muriel Auzan*, Violaine Chapuis*, Joanne Young*, Anne Béghin**, Pauline Ménager*, Sébastien Degot*.

細胞種在常規培養皿時細胞呈現不同的形狀,細胞內的結構, 變異性更是大。創新的 CYTOO micropattern , 可標準化細胞的形狀和形態, 使細胞表現出重複性極高的內部架構,克服細胞圖像定量分析中精確度的挑戰。

Unveiling drug-induced phenotypes on micropatterned cells

HeLa cells were seeded in parallel on full fibronectin or on fibronectin L micropatterns, then treated with drugs at 10µM for 1h (except for Nocodazole at 5µM) or left untreated. Nucleus; Actin; Fibronectin micropattern



Robust quantification of drug effects with only 50 cells

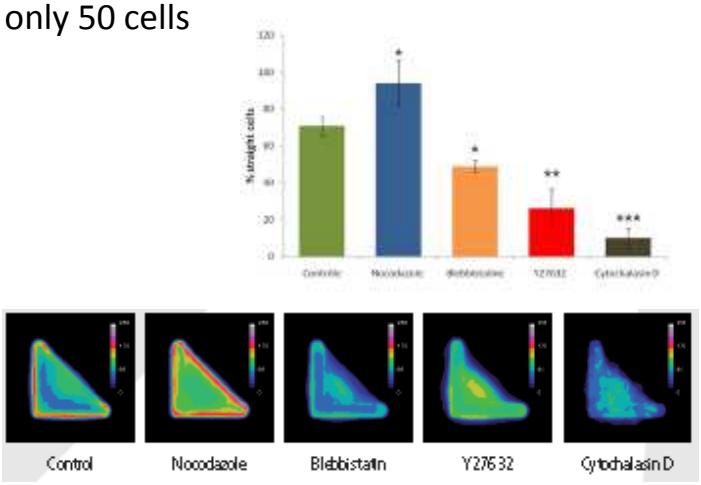


Figure 3: Reference Cell gallery depicting drug effects on the actin distribution in cells on L micropatterns and performed in a 96-well CYTOOplate™. Nocodazole (5µM), Blebbistatin (10µM), Y27632 (10µM) and Cytochalasin D (10µM), n=50 cells for all conditions.

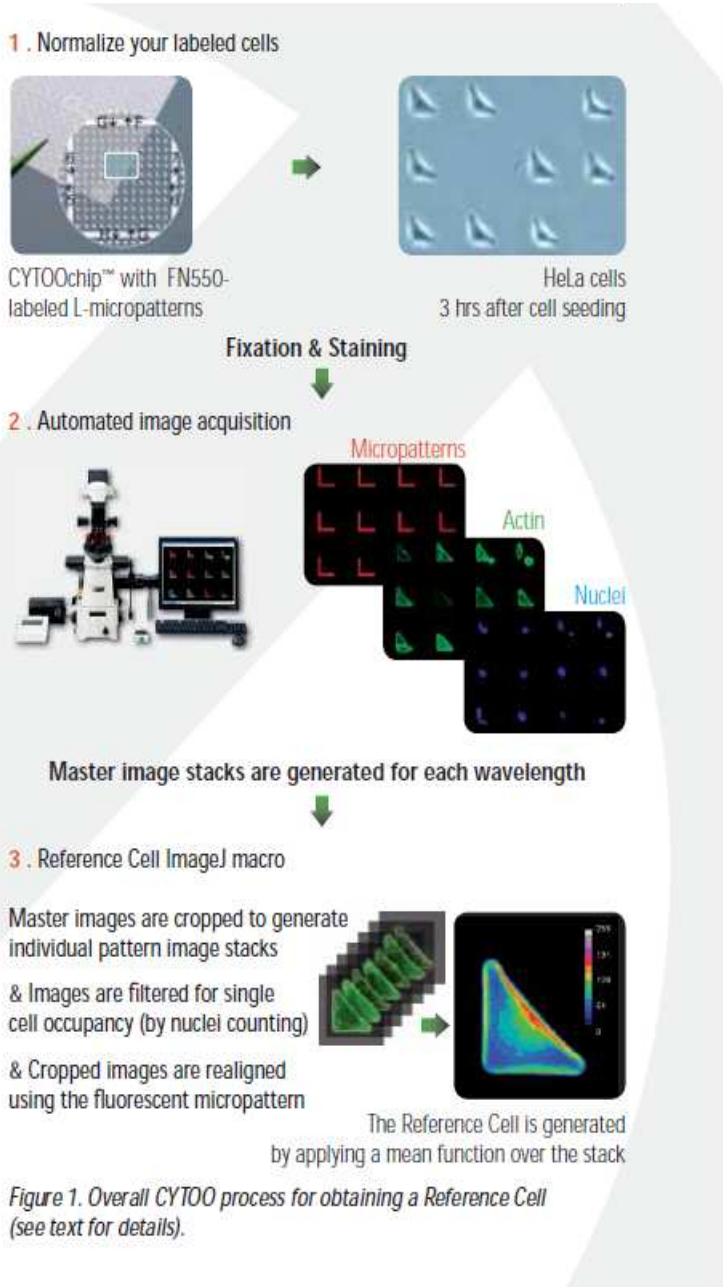

Figure 1. Overall CYTOO process for obtaining a Reference Cell (see text for details).

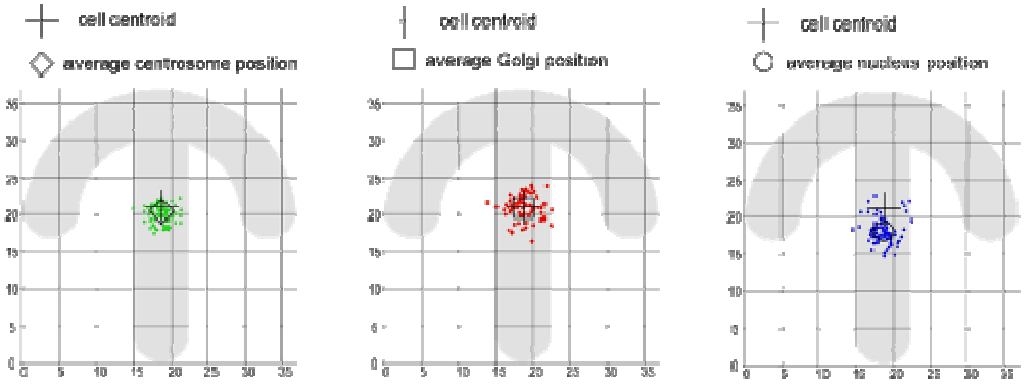
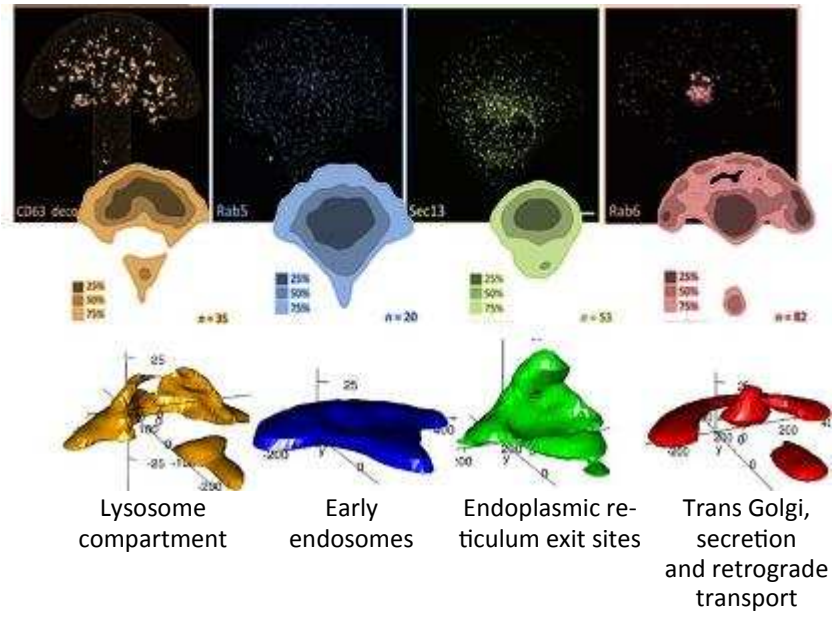
Reproducible internal cell organization in response to the geometry of the micropattern

看看標準化極性的細胞胞器的分布！！



Thiery et al. PNAS (2006)

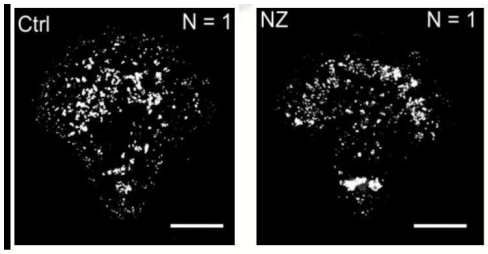
Quantifying the undetectable: Probabilistic density maps on normalized cells



Lysosome compartment | Early endosomes | Endoplasmic reticulum exit sites | Trans Golgi, secretion and retrograde transport

http://www.cytoo.com/CYTOO-applications-endomembrane-network.php

Figure 1: Stable density maps that represent the organization of different endomembrane compartments were obtained from the indicated number of cells (n=35 to 82). 2D and 3D density maps of multivesicular bodies (CD63), early endosomes (Rab5), ER exit sites (Sec13) and the secretory compartment (Rab6) are shown.



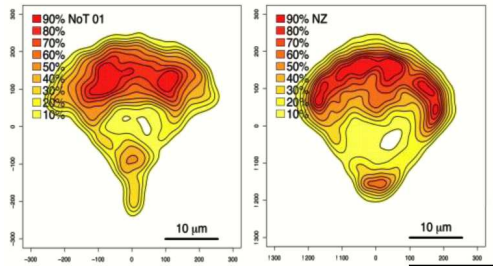


Figure 2:
Top: representative images of individual cells labeled with anti CD63 (left: control, right: nocodazole) yield little insight into the effect of this drug on the multivesicular body (MVB) network.
Bottom: 2D Density maps calculated for the MVB compartment show significant differences between the control and the Nocodazole (NZ) treated cells. Automatically calculated P value < 10-4 with only 20 cells.

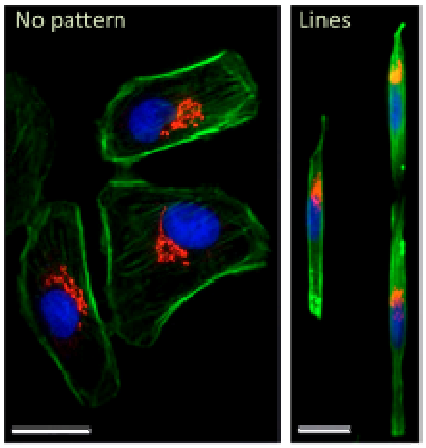
CYTOO chips™ & CYTOO plates™ Motility

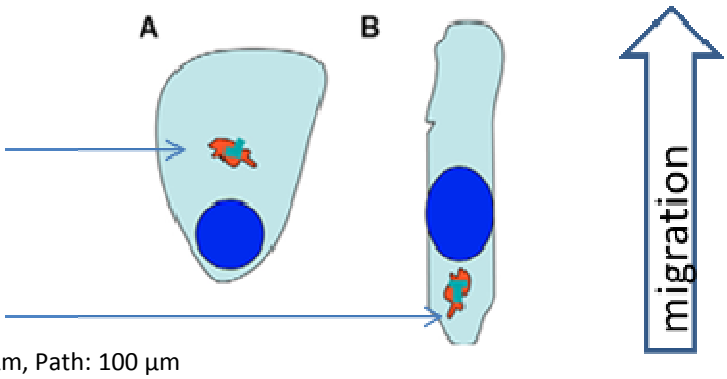
Cell Migration

Cells on fibronectin-patterned lines are polarized



Pouthas F, J Cell Science 2008

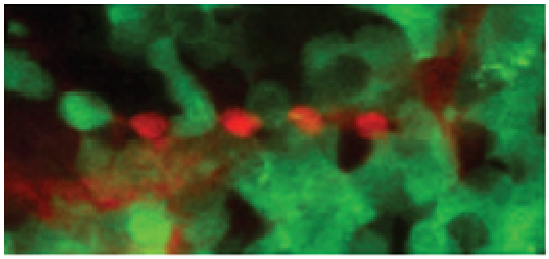
Distinctive mode of migration

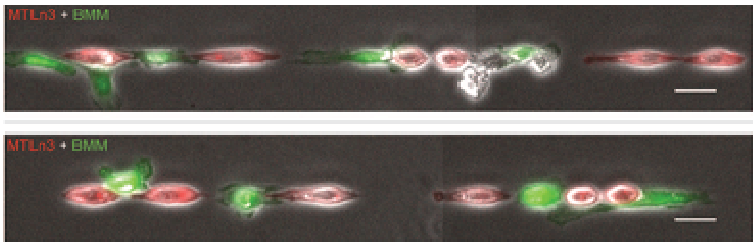


Nodediameter: 70 µm, Path: 100 µm
Structure optimizedfor SH-SY5Y neuroblastomacellline
Protein: PDL; Cytophobigcoating: PLL-g-PEG
Formation of neuriteconnection between adjacent groups of cells; 6 to 10 cell bodies per pattern in average

Model for macrophage- tumor cell pairing and streaming :

robust & physiological





Courtesy of Landes Bioscience, reproduced from IntraVital 2012;1(1):77-85. (Left: in vivo imaging and Right: in vitro imaging on micropatterned 1D tracks)

Model similarities between in-vivo and 1D micropatterns:

- MorphologyBehaviors
- Motility rates

Specificities:

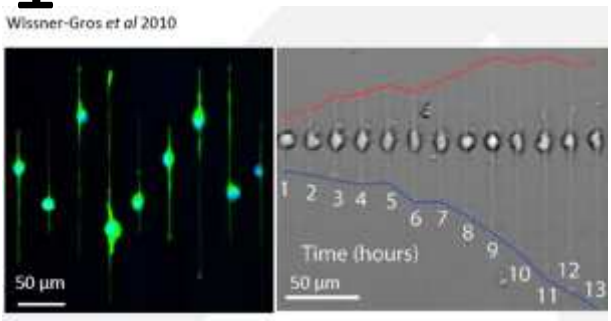
- Tumor cell velocity on 1D reproduce high velocity in vivo (2D model: velocity 10 folder lower)
- Assembly of alternating tumor cells and macrophages identified as steams in vivo were reproduced on 1D lines

CYTOOplate Neuro plate

http://www.youtube.com/watch?v=0rglGMAP78c

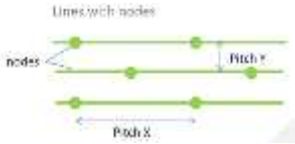
1

Bipolar neuriteoutgrowth & Migration

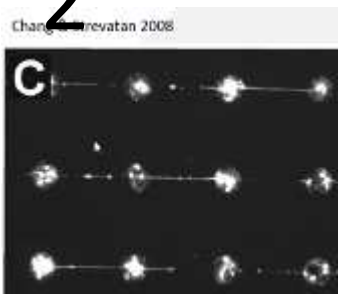


- Neurite outgrowth is highly bi-directional; no branching observed
- Easy single cell neurite length quantification possible
- But the position of cell bodies is not controlled

2

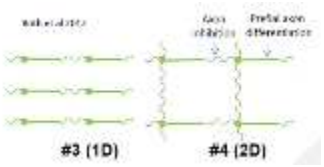


Controlling neuriteoutgrowth & Cell body position

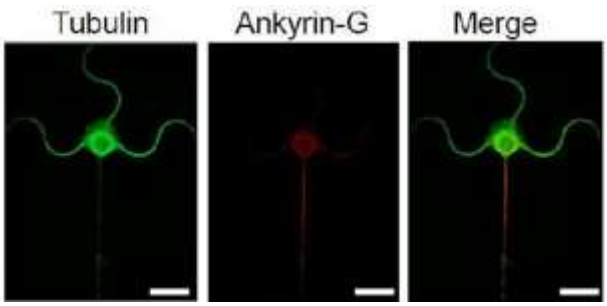


- Cell bodies and outgrowing processes are clearly separated
- The neuronal cell bodies adhere preferentially to the nodes where local adhesiveness is greater and are stabilized there

3 & 4

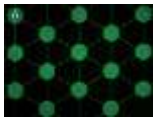


Single neuron network with axon Guidance.
Neuron polarization

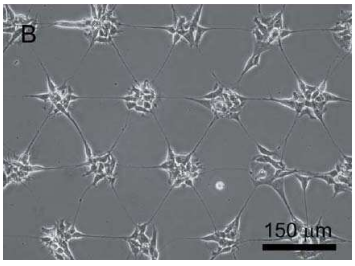


- The curved path geometry provides a strong inhibitory effect on axon specificationand prevents multiple axon formation. Axon rafficking studies are facilitated.
- Curved lines for neuriteoutgrowth are supposed to mimic in vivo neuron path-finding in a crowded environment

5

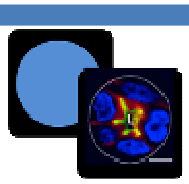


Network Formation Assay



- Connections are progressively created between nodes within 72 h
- Quantification of network formation= Number of connections per node
- Kinetics of neuriteoutgrowth can be measured in time lapse

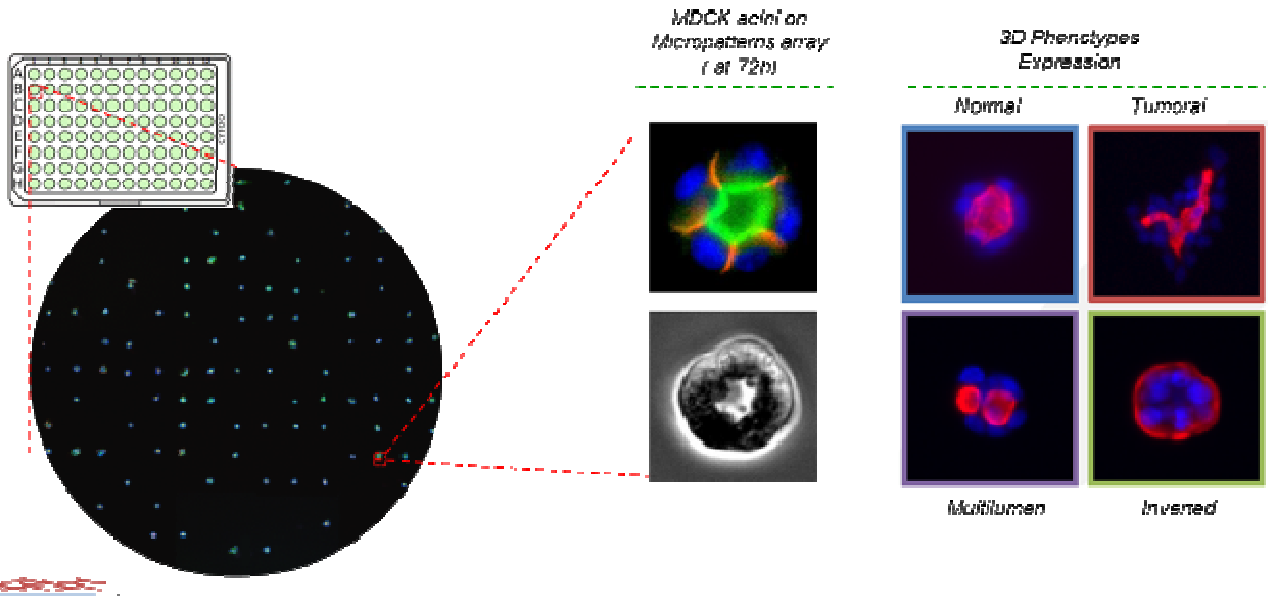
3D+
Cell structures

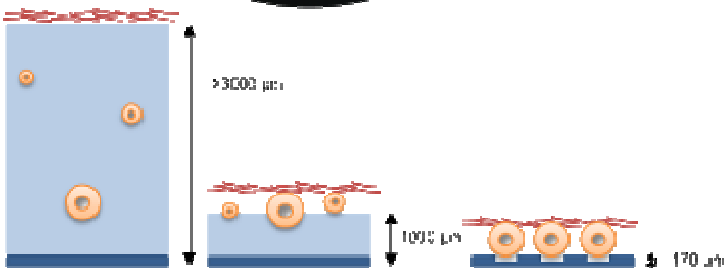


- Acini formation
- Spheroids
- Kidney tubes

3D+ Technologies :

Normalized Acini Structures





- Screening of drugs in a 3D and automated context
- Validate Drug Targets and Candidates in a polarized 3D context
- Model the effect of Oncogenes, tumor suppressors

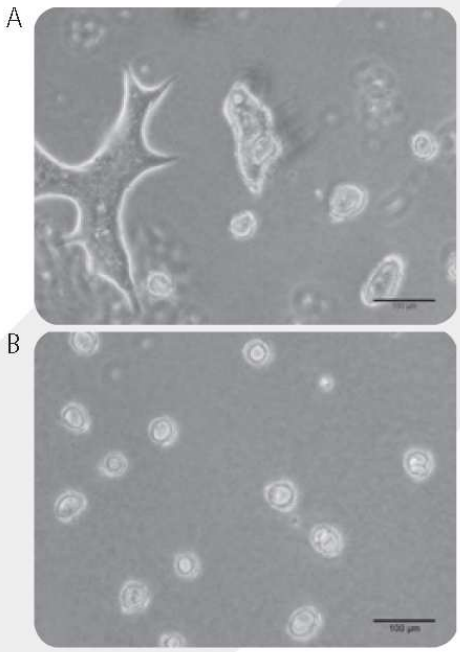
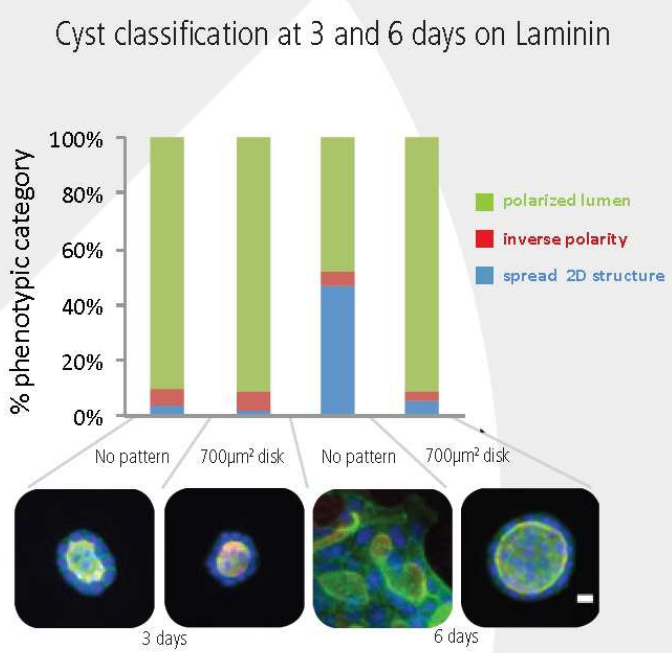
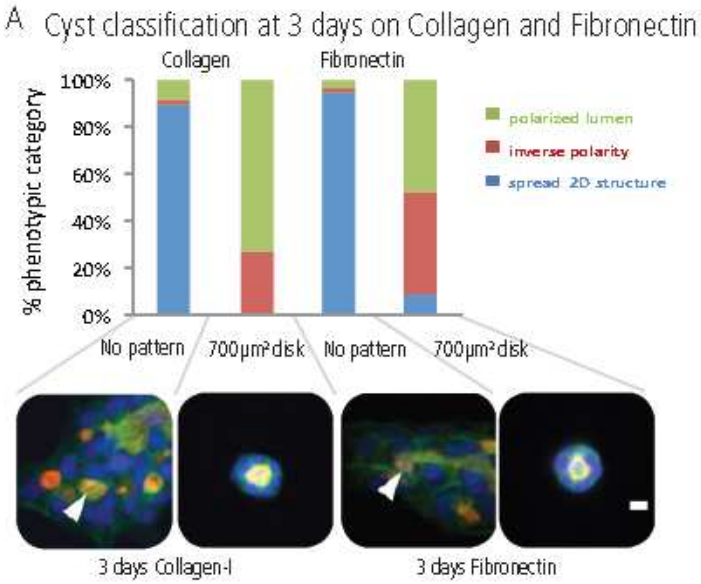
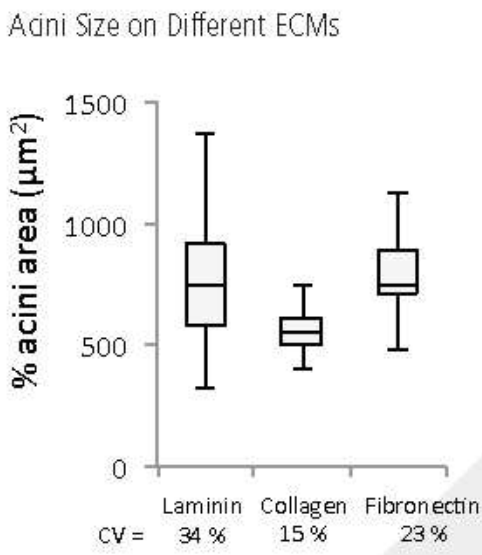
取得以下操作技術資料請洽聯創世紀生技:

- Protocol for seeding MDCK cells on CYTOOchips (MO-EXT-19)
- Hints for using Matrigel (MO-EXT-20).









配合 micropattern, ECM coating, 取代膠體的 3D 細胞培養, 使 MDCK 細胞的 Acini 大小及形成比例再現性更高,結構可維持更久, 並且在 Collagen-I 及 Fibronectin 的基質也能形成 Acini。

ECM	**Laminin-111**		**Collagen-I**		**Fibronectin**	
2D versus 2D+	***No pattern***	***µpattern***	***No pattern***	***µpattern***	***No pattern***	***µpattern***
Lumen formation efficiency (%) at 3 days						
Chip format	70-90	70-90	0	70	0	50
96-well plate	75	60	N.A	40	N.A	N.T
Acini size distribution (CV%)						
Chip format	34	34	N.A	15	N.A	23
Conclusion	Without micropatterns acini collapse and degenerate after 3 days	Laminin coated micropatterns sustain long-term 3D culture. Best conditions for high levels of lumen formation.	N.A	On collagen-I acini formation is dependent on micropatterns. Best conditions for creating a uniform population.	N.A	On fibronectin acini formation is dependent on micropatterns.

Table 3: Performance of conventional 2D flat surfaces compared to 2D+ micropatterns. N.A = Not Applicable. N.T = Not tested
